

Package ‘fastcpd’

September 6, 2023

Type Package

Title Fast Change Point Detection Based on Dynamic Programming with Pruning
with Sequential Gradient Descent

Version 0.5.3

Description Implements fast change point detection algorithm based on the paper
“Sequential Gradient Descent and Quasi-Newton's Method for Change-Point
Analysis” by Xianyang Zhang, Trisha Dawn
<<https://proceedings.mlr.press/v206/zhang23b.html>>.

fastcpd

*fastcpd: A package for finding change points in an efficient way***Description**

The fastcpd package provides a function `fastcpd` to find change points in a data set. The function is based on the paper “Sequential Gradient Descent and Quasi-Newton’s Method for Change-Point Analysis” by Xianyang Zhang and Trisha Dawn.

Usage

```
fastcpd(
  formula = y ~ . - 1,
  data,
  beta = NULL,
  segment_count = 10,
  trim = 0.025,
  momentum_coef = 0,
  k = function(x) 0,
  family = NULL,
  epsilon = 1e-10,
  min_prob = 10^10,
  winsorise_minval = -20,
  winsorise_maxval = 20,
  p = NULL,
  cost = negative_log_likelihood,
  cost_gradient = cost_update_gradient,
  cost_hessian = cost_update_hessian,
  cp_only = FALSE,
  vanilla_percentage = 0
)
```

Arguments

<code>formula</code>	A symbolic description of the model to be fitted.
<code>data</code>	A data frame containing the data to be segmented.
<code>beta</code>	Initial cost value.
<code>segment_count</code>	Number of segments for initial guess.
<code>trim</code>	Trimming for the boundary change points.
<code>momentum_coef</code>	Momentum coefficient to be applied to each update.
<code>k</code>	Function on number of epochs in SGD.
<code>family</code>	Family of the models. Can be "binomial", "poisson", "lasso" or "gaussian". If not provided, the user must specify the cost function and its gradient (and Hessian).
<code>epsilon</code>	Epsilon to avoid numerical issues. Only used for binomial and poisson.
<code>min_prob</code>	Minimum probability to avoid numerical issues. Only used for poisson.

winsorise_minval	Minimum value to be winsorised. Only used for poisson.
winsorise_maxval	Maximum value to be winsorised. Only used for poisson.
p	Number of parameters to be estimated.
cost	Cost function to be used. If not specified, the default is the negative log-likelihood for the corresponding family.
cost_gradient	Gradient for custom cost function.
cost_hessian	Hessian for custom cost function.
cp_only	Whether to return only the change points or with the cost values for each segment. If family is not provided or set to be "custom", this parameter will be set to be true.
vanilla_percentage	How many of the data should be processed through vanilla PELT. Range should be between 0 and 1. If set to be 0, all data will be processed through sequential gradient descnet. If set to be 1, all data will be processed through vaniall PELT. If the cost function have an explicit solution, i.e. does not depend on coefficients like the mean change case, this parameter will be set to be 1.

Value

A class fastcpd object.

Citation

Zhang, Xianyang, and Trisha Dawn. "Sequential Gradient Descent and Quasi-Newton's Method for Change-Point Analysis" arXiv preprint arXiv:2210.12235 (2022).

Examples

```

fastcpd-class

An S4 class to store the output created with [fastcpd](#)

Description

This S4 class stores the output from [fastcpd](#). A fastcpd object consist of several slots including the call to [fastcpd](#), the data used, the family of the model, the change points, the cost values, the residuals, the estimated parameters and a boolean indicating whether the model was fitted with only change points or with change points and parameters, which you can select using @.

Slots

call The call to [fastcpd](#).

data The data used.

family The family of the model.

cp_set The change points.

cost_values The cost values for each segment.

residuals The residuals for each segment.

thetas The estimated parameters for each segment.

cp_only A boolean indicating whether the model was fitted with only change points or with change points and parameters.

plot.fastcpd

Plot the data and the change points for a fastcpd object

Description

Plot the data and the change points for a fastcpd object

Usage

```

## S3 method for class 'fastcpd'
plot(x, ...)

## S4 method for signature 'fastcpd,missing'
plot(x, y, ...)

```

Arguments

x	fastcpd object.
...	Ignored.
y	Ignored.

print.fastcpd	<i>Print the call and the change points for a fastcpd object</i>
---------------	--

Description

Print the call and the change points for a fastcpd object

Usage

```
## S3 method for class 'fastcpd'
print(x, ...)

## S4 method for signature 'fastcpd'
print(x, ...)
```

Arguments

x	fastcpd object.
...	Ignored.

show.fastcpd	<i>Show the available methods for a fastcpd object</i>
--------------	--

Description

Show the available methods for a fastcpd object

Usage

```
## S3 method for class 'fastcpd'
show(object)

## S4 method for signature 'fastcpd'
show(object)
```

Arguments

object	fastcpd object.
--------	-----------------

summary.fastcpd	<i>Show the summary of a fastcpd object</i>
-----------------	---

Description

Show the summary of a fastcpd object

Usage

```
## S3 method for class 'fastcpd'  
summary(object, ...)
```

```
## S4 method for signature 'fastcpd'  
summary(object, ...)
```

Arguments

object	fastcpd object.
...	Ignored.
